Hepatitis C (HCV for short) is a virus that lives in human blood. A virus is one of the smallest living things known to exist inside plants and animals. HCV makes new hepatitis C viruses by infecting the liver, and after many years the liver can become so damaged by hepatitis C that it cannot perform many of the important jobs that it must do to keep us healthy.

What is Hepatitis C?

You can only get hepatitis C by getting HCV infected blood from someone who has hepatitis C, and ONLY if that infected blood gets into your body. If you have hepatitis C you should make sure that your blood does not come into contact with someone else's blood.

REMEMBER

- Many people have hepatitis C so you are not alone. It takes many years for hepatitis C to cause damage to the liver and to make someone sick.
- There are many things that people can do to help fight hepatitis C, and the best time to start is early – before hepatitis C has a chance to damage your liver.
- One of the most important things you can do is to stop or cut down on drinking alcohol.
- There are also medicines to get rid of hepatitis C that work in over 9 out of 10 people treated.
- Talk with your doctor or nurse about monitoring hepatitis C and the about the drugs used to treat and cure hepatitis C.

Get Tested. Get Treated. Get Cured.
