Alcohol and HCV

Foreword

One of the first recommendations given to patients with hepatitis C virus (HCV) infection is to abstain from alcohol use. This recommendation is especially important for HCV patients undergoing antiviral therapy. Patients who drink during HCV treatment are less likely to clear the virus. Both the American Association for the Study of Liver Diseases (AASLD) and the National Institutes of Health (NIH) Consensus statement strongly encourage that HCV patients avoid all alcohol use.

Alcohol abstention is recommended for HCV patients in much the same way as it is suggested that one wear a parachute when jumping from an airplane. It is not a debatable recommendation. Yet despite this, some patients want hard facts. Can they drink a “little” or “on special occasions”? The answer to this is not known, but total abstinence is advised. In short, why take an unnecessary risk? As one patient put it, “I view occasional moderate drinking in much the same way as Russian roulette; it’s like putting a gun to my liver, pulling the trigger, and hoping I don’t shoot myself.” One thing we know for certain, alcohol does not improve liver health.

Unfortunately some individuals find it difficult to give up drinking. According to a study conducted by the National Institute of Alcohol Abuse and Alcoholism (NIAAA), more than 30% of Americans have abused alcohol at some point. Alcohol abuse doesn’t just affect livers. It can threaten the immune system, the brain, financial security, relationships, and families. In short, it can influence every aspect of life.

How do you know if you have a drinking problem? There are questionnaires that can help you identify if you have an alcohol problem (see Resources). The NIAAA suggests using the CAGE questionnaire:

“Answering the following four questions can help you find out if you or a loved one has a drinking problem:
Alcohol and HCV

1. Have you ever felt you should cut down on your drinking?

2. Have people annoyed you by criticizing your drinking?

3. Have you ever felt bad or guilty about your drinking?

4. Have you ever taken a morning eye-opener (drink first thing in the morning)?

One “yes” answer suggests a possible alcohol problem. More than one “yes” answer means it is highly likely that a problem exists. If you think that you or someone you know might have an alcohol problem, it is important to see a doctor or other health care provider right away. They can help you determine if a drinking problem exists and plan the best course of action. Alcoholics Anonymous has its own self-test “Is AA for You?” www.aa.org/lang/en/subpage.cfm?page=71

If you are unable to quit drinking, you may need help. Alcoholism is a disease, not a character flaw. There are many resources to assist those with alcohol problems, including professional, non-professional, self-help, spiritual, and secular-based approaches. If one method does not work, try another until you find one that works for you.
